

FNXPERS SDN. BHD.

Web Developer Assessment (Laravel)

Version: 2

Build an admin panel to manage companies

This project aims to handle companies and their employees, essentially functioning as a Mini-CRM.

- ❖ **Basic Laravel Authentication:** Allows administrators to log in.
- ❖ **Database Seeds:** Utilize database seeds to create the initial user with the email admin@admin.com and the password "password."
- ❖ **CRUD Functionality:** Implement Create / Read / Update / Delete operations for two main menu items: Companies and Employees.
- ❖ **Companies Database Table:** Includes fields such as Name (required), email, logo (minimum 100x100), and website.
- ❖ **Employees Database Table:** Includes fields like First Name (required), Last Name (required), Company (foreign key linking to Companies), email, and phone.
- ❖ **Database Migrations:** Use database migrations to create the specified schemas and use Eloquent models to define relationships between data tables.
- ❖ **Logo Storage:** Store company logos in the storage/app/public folder and ensure accessibility from the public domain.
- ❖ **Validation and Pagination:** Implement Laravel's validation functions using Request classes. Utilize Laravel's pagination feature to display lists of Companies and Employees with 10 entries per page.
- ❖ **Resource Controllers:** Employ basic Laravel resource controllers with default methods (index, create, store, etc.).
- ❖ **Authentication and Theme:** Use Laravel's starter kit for authentication and basic themes; However, disable the registration functionality.
- ❖ **API and Web Routes:** Make use of both API and web routes.
- ❖ **API Response:** Create an API endpoint that returns a single company with a list of employees. Include the 'employee_count' as an attribute in the API response model.
- ❖ **Testing:** Ensure that the API can be tested using Postman or any other preferred alternatives.

Screenshots: Include screenshots showing the working **CRUD UI**, **pagination**, and **API response**.

The completed project must be pushed to a Git repository (e.g., GitHub, GitLab, or Bitbucket) and the repository link should be submitted for review. Ensure the project includes the necessary README file.
